Title R Bindings for 'GlareDB'

Version 0.0.3

URL <https://github.com/eitsupi/r-glaredb>

BugReports <https://github.com/eitsupi/r-glaredb/issues>

Description R bindings for 'GlareDB', an analytical database based on 'Apache Arrow' and 'Apache DataFusion' that can connect to various data sources and execute queries.

Index**6**

as_glaredb_table	<i>Create a GlareDB table</i>
------------------	-------------------------------

Description

A class that has a struct similar to [arrow::Table](#) innerly and can be converted to other classes via [nanoarrow::as_nanoarrow_array_stream\(\)](#).

Usage

```
as_glaredb_table(x, ...)

## Default S3 method:
as_glaredb_table(x, ..., schema = NULL)

## S3 method for class 'nanoarrow_array_stream'
as_glaredb_table(x, ...)

## S3 method for class 'RGlareDbExecutionOutput'
as_glaredb_table(x, ...)
```

Arguments

- x An object to be coerced to a GlareDB table.
- ... Additional arguments passed to methods.
- schema An optional schema used to enforce conversion to a particular type. Defaults to [infer_nanoarrow_schema\(\)](#).

Value

A [GlareDB table](#).

Examples

```
con <- glaredb_connect()

# Create a GlareDB table from a data frame with a specified schema
dat <- data.frame(a = 1:3, b = letters[1:3]) |>
  as_glaredb_table(
    schema = nanoarrow::na_struct(
      list(
        a = nanoarrow::na_int64(),
        b = nanoarrow::na_large_string()
      )
    )
  )
```

```
# Run an SQL query against the connection,
# and convert the result to a GlareDB table
glaredb_sql("SELECT * FROM dat", con) |>
  as_glaredb_table()

# Convert the GlareDB table to an arrow Table
if (requireNamespace("arrow", quietly = TRUE)) {
  dat |>
    arrow::as_arrow_table()
}

# Convert the GlareDB table to a polars DataFrame
if (requireNamespace("polars", quietly = TRUE)) {
  dat |>
    polars::as_polars_df()
}
```

glaredb_connect *Connect to a GlareDB database*

Description

Connect to a GlareDB database

Usage

```
glaredb_connect(
  data_dir_or_cloud_url = NULL,
  ...,
  spill_path = NULL,
  disable_tls = FALSE,
  cloud_addr = "https://console.glaredb.com",
  location = NULL,
  storage_options = NULL,
  env = parent.frame()
)
```

Arguments

data_dir_or_cloud_url	A character of path to a local GlareDB database or a cloud URL or NULL. If NULL, a in-memory database is used.
...	Ignored.
spill_path	TODO
disable_tls	TRUE or FALSE to indicating whether to disable TLS.
cloud_addr	A character of a GlareDB cloud URL.
location	TODO

<code>storage_options</code>	Named character vector of storage options or NULL (default).
<code>env</code>	TODO

Value

GlareDB connection object

Examples

```
con <- glaredb_connect()
con

glaredb_sql("SELECT 'hello from R' as hello", con) |>
  as_glaredb_table()
```

<code>glaredb_sql</code>	<i>Run a query against a GlareDB database</i>
--------------------------	---

Description

Run a query against a GlareDB database

Usage

```
glaredb_sql(query, connection = NULL)

glaredb_prql(query, connection = NULL)

glaredb_execute(query, connection = NULL)
```

Arguments

<code>query</code>	A character of the query to run. <ul style="list-style-type: none"> • For <code>glaredb_sql()</code> and <code>glaredb_execute()</code>, an SQL query. • For <code>glaredb_prql()</code>, a PRQL query.
<code>connection</code>	A GlareDB connection object or NULL. If NULL, the default in-memory database is used.

Value

GlareDB execusion output. For `glaredb_execute()`, the value is returned invisibly.

Examples

```
glaredb_sql("SELECT 'hello' from R' as hello") |>
  as_glaredb_table()

glaredb_prql("from [
  {a=5, b=false},
  {a=6, b=true},
]")
  |>
  as_glaredb_table()

glaredb_execute("CREATE TABLE my_table (a int)")
glaredb_execute("INSERT INTO my_table VALUES (1), (2)")
glaredb_sql("SELECT * FROM my_table") |>
  as_glaredb_table()
```
